Python Day 1 – Assignment

First-day concepts and practice questions

Part 1: Concept Questions

Answer each of these in your own words. Short answers are fine; examples make them better.

1. What is the difference between a **register** and **RAM**?
2. What are **low-level, middle-level, and high-level languages**? Give one example of each.
3. What is **OOP** (Object-Oriented Programming)?
4. What is **garbage collection**?
5. What is the difference between **compile time** and **runtime**?
6. What are parentheses `()` used for in Python?
7. What is the difference between a **compiler** and an **interpreter**? Which one does Python use?

Part 2: Multiple Choice Questions

Choose the best answer for each question.

Python Basics

Q1. Which of the following is NOT a feature of Python?

- A. Dynamic typing
- B. Interpreted language
- C. Code readability
- D. Low-level operations

Q2. What is the role of indentation in Python?

- A. It is used only for code formatting and has no effect on execution
- B. It defines code blocks such as loops, functions, and conditionals
- C. It is required only inside functions
- D. It is optional but recommended

Q3. What type of programming paradigms does Python support?

- A. Only procedural programming
- B. Only object-oriented programming
- C. Multiple programming paradigms
- D. Only functional programming

Output

Q4. What is the output of the following command in Python?

```
print("Hello, World!")
```

- A. Hello World
- B. "Hello, World!"
- C. Hello, World!
- D. Hello, World

Q5. Which of the following is used to output data in Python?

- A. output()
- B. print()
- C. echo()
- D. display()

Q6. Which function is primarily used to display output in Python?

- A. output()
- B. display()
- C. print()
- D. show()

Q7. Which of the following is NOT a valid way to print output in Python?

- A. print("Hello, World!")
- B. sys.stdout.write("Hello, World!")
- C. write("Hello, World!")
- D. print(f"Hello, World!")

Input

Q8. What is the default return type of the input() function in Python?

- A. Integer
- B. String
- C. Float
- D. List

Q9. How can you convert a string input to an integer in Python?

- A. str(input())
- B. int(input())
- C. float(input())
- D. list(input())

Q10. In Python, how can you take multiple inputs from the user in one line?

- A. Using input() with multiple parameters
- B. Using split() method on input()
- C. Using a loop to gather input
- D. Using list() to capture inputs
